Sequence 7, Application US/0980503

Patent No. US20020131964A1

GENERAL INFORMATION:
APPLICANT: CINES, Douglas B
APPLICANT: HIGAZI, Abd Al-Roof
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR MODULATING MUSCLE CELL AND
TITLE OF INVENTION: TISSUE CONTRACTABILITY
FILE REFERENCE: 9596-331
CURRENT APPLICATION NUMBER: US/09/880,503
CURRENT FILING DATE: 2001-06-13
PRIOR PEPLICATION NUMBER: US 60/212,847
PRIOR FILING DATE: 2000-06-20
                                                                                                                                                                                                                                                                    APPLICANT: CINES, Douglas B

Sequence 5, Application US/09880503
Patent No. US20020131964A1
GENERAL INFORMATION:
GENERAL INFORMATION:
TOTAL OF INVENTION: COMPOSITIONS AND METHODS FOR MODULATING MUSCLE CELL AND TITLE OF INVENTION: TISSUE CONTRACTABILITY
TITLE OF INVENTION: TISSUE CONTRACTABILITY
TITLE OF INVENTION: TISSUE CONTRACTABILITY
TITLE OF INVENTION: TISSUE CONTRACTABILITY
CURRENT APPLICATION NUMBER: US/09/880,503
CURRENT APPLICATION NUMBER: US 60/212,847
PRIOR FILING DATE: 2000-06-20
NUMBER OF SEQ ID NOS: 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                              240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TITLE OF INVENTION: NOVEL BIOLOGICALLY ACTIVE POLYPEPTIDES,
PREPARATION THEREOF AND PHARMACEUTICAL COMPOSITION
CONTAINING SAID POLYPEPTIDES
                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 4, Application US/09880503

Sequence 4. Application US/09880503

Patent No. US20020131964A1

GENERAL INFORMATION

APPLICANT: CIRES, Douglas B

APPLICANT: HIGAZI, Abd Al-Roof

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR MODULATING MUSCLE CELL AND

TITLE OF INVENTION: TISCUE CONTRACTABILITY

FILE REFERENCE: 9596-331

CURRENT APPLICATION NUMBER: US/09/880,503

CURRENT FILING DATE: 2001-06-13

PRIOR APPLICATION NUMBER: US 60/212,847

PRIOR FILING DATE: 2000-06-20

NUMBER OF SEQ ID NOS: 18

SOFTWARE: PatentIn Ver. 2.1
                                                                                                                                                                             61 KASTDIMGRPCLPWNSATVLQQIYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVOVGLK 120

Sequence 12, Application US/08797689
Fatent No. 587659
GENERAL INFORMATION:
APPLICANT: Fleer, Reinhard
APPLICANT: Guitton, Jean-Dominique
APPLICANT: Jung, Gerard
APPLICANT: Yeh, Patrice
TITLE OF INVENTION: NOVEL BIOLOGICALLY ACTIVE POLYPEPTIDES,
TITLE OF INVENTION: CONTAINING SAID POLYPEPTIDES,
TITLE OF INVENTION: REPRARATION THEREOF AND PHARMACEUTICAL COMPOSITION
TITLE OF INVENTION: OFFICE STORMANDES
NUMBER OF SEQUENCES: 36
Patent No. 5520

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                           US-09-880-503-4

```
The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian wascle, endothelial cell or tissue. The composition is used for treating stroke, bypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, angiogenic disorders, pulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, diabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory discress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder as asthma, adult respiratory discress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sequence is human urokinase-type plasminogen activator (uPA) amino
                                                                                                                                               treating atherosclerosis, asthma, hypertension, glaucoma, impotence, comprising domains from urokinase-type plasminogen activator
                                                                                                   Composition for modulating muscle cell and tissue contractility for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human uPA amino terminal fragment (ATF) and connecting peptide.

The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and anglogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occludions, thrombotic microrangiopathies, surgically induced thrombotic disorders, angiogenic disorders, tumour cell metastasis, glaucoma, invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, clabelic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sequence is human urokinase-type plasminogen activator (uPA) amino terminal fragment (ATF) and connecting peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 KASTDTWGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120

cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders in a patient's genome that affect the activity of P by expressing in a patient's genome that affect the activity of P by expressing in an active proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteinn. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. Additionals and AAB77789 represent sequences used in the exemplification of the

The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigen and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastist to tunours of ovarian or breast origin, reproductive system clisorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infertility, disorders of pregnancy, anovulation, chock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and varian disorders, incedimental and acquired incorders, incedimental and acquired conditions (e.g., anaemia) cardiovacular disorders. Incommental disorders, gastrointestinal disorders of unitnary system disorders, or opportitis, systemic lupus erythematosus, chock-related disorders, neurological disorders, gastrointestinal disorders and utinary system disorders. Ovarian antigen polypeptides and compounds which modulate ovarian antigen expression or activity. The polynucleotides may also be used in screening for compounds which collectides may also be used in screening for compounds which collectides may also be used an antigen polypeptides and the collectides may also be used in screening for compounds will descreen the apply, druggered antibodies useful in disease diagnosis, drug targeting and phenotyping. The present collectication, but was obtained in electronic format directly from WIPO cat fitp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 KASTDIMGRPCLPWNSAIVLQQIYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120

Urokinase zymogen is cleaved into the two-chain form composed of characteristic urokinase H (molecular wt.of 30,000) and L (molecular wt.of 20,000) and L decular wt.of 20,000 and L decular The patentors claim a new urokinase zymogen which has mol. wt. ca. 50,000, a single chain molecular structure, and selective affinity for fibrin. It is a thrombolytic agent which manifests its plasminogen activator activity on cleavage by proteolytic enzymes (e.g. plasmin) and has higher affinity for fibrin than known forms Thrombolytic agent; plasminogen activator activity; fibrin affinity; /note= "potential cleavage site which generates
the two-chain form from the zymogen" Sequence encoded by cDNA sequence for human urokinase zymogen (Japanese Patent Application No.37119/84). Sequence g ઠ ò The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic invasion, tumour cell angiogenesis, pulmonary fibrosis, asthma, tumour cell angiogenesis, tumour cell metastasis, glaucoma, disorder, male impotence, respiratory disease or condition contraction disorder, male impotence, respiratory disease or condition width chronic intrapulmonary fibrin formation. The present sequence is human urokinase-type plasminogen activator (UPA) single chain urokinase (scuPA) deletion mutant designated as scuPA deltal36-143. ö 120 Human; urokinase-type plasminogen activator; uPA; therapy; hypertension; stroke; hypotension; atherosclerosis; heart attack; thrombotic disorder; pulmoravy aftbrosis, asthmancrovascular occlusion; angiogenic disorder; pulmonary fibrosis, asthma; tumour cell metastasis; glaucoma; diabetic retinopathy; wound healing; clotting disorder; userine contraction disorder; respiratory disease; male impotence; adult respiratory distress syndrome; scuPA deltal36-143; KASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120 9 9 KASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDNRRPWCYVQVGLK 1 SNELHOVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG SNETHOVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHFYRG Gaps Composition for modulating muscle cell and tissue contractility for treating atherosclerosis, asthma, hypertension, glaucoma, impotence, comprising domains from urokinase-type plasminogen activator -., 100.0%; Score 793; DB 23; Length 403; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New variants of human prourokinase (hPUK) comprise a hPUK deficient in (i) at least part of the first loop region of the epidermal growth leactor (BEF) domain; (ii) at least part of the first loop and at least part of the first loop and at least part of the second loop; or (iii) at least part of the third loop. The hPUK variants show an increased blood half-life comparable to that of the whole EGF domain-deficient hPUK variant and urokinase while retaining the same properties as those of hPUK. They have potent thrombolytic activity and very little tendency to cause spontaneous bleeding. The present sequence is that of the wild-type hPUK protein, including the EGF domain.
                                                                                                                                                                                                                                                   Human, prourokinase; hPUK; variant; half-life; increase; EGF; epidermal growth factor domain; deletion; thrombolysis; fibrinolysis.

                                                                                                                                                                                                                                                                                                                                                                                                                                            Urokinase precursor-lipid composite - used as thrombolytic agent, having prolonged half-life in the blood, enhanced bio:availability and improved activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  By forming a precursor-lipid composite, the half-life of this thrombolytic agent in the blood may be increaced, exhibiting improved activity without abnormal acceleration of fibrinolytic activity. Compound is useful as a thrombolytic agent in treatment of cerebral thrombosis, myocardial infarction etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            UK-T4 is one example of a plasminogen activator which differs from natural human pro-urokinase at positions 153 and 155 (Leu substituted by Ser; Pro substituted by Thr. respectively). The derivative has decreased susceptibility to thrombin compared to natural type pro-UK and higher specific activity.

These mutants have a longer half-life in the blood and a higher thrombolytic ability.
      "Ser, Asn, Pro, Gly, or Tyr in the region 10 to 60 in the N-terminal of the human PUK can be replaced by Thr, Pro or Ala"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        UK-S3 is one example of a plasminogen activator which differs from natural human pro-urokinase at positions 153 and 155. (Leu substituted by Asn; Pro substituted by Thr, respectively). The derivative has decreased susceptibility to thrombin compared to natural type pro-UK and higher specific activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                100.0%; Score 793; DB 12; Length 411; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 SNELHQVPSNCDCLNGGTCVSNKYFSNIHWCNCPKKFGGQHCEIDKSKTCYEGNGHPYRG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation
                                                            Pro-urokinase; thrombolysis; fibrin clot lysis; mutant Ala300; reduced fibrinogenolysis; non-specific plasminogen activation; systemic bleeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 793; DB 16;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysts of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992-R63008 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the reatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation
                                                                                                                                                                                  Pro-urokinase; thrombolysis; fibrin clot lysis; mutant His300; reduced fibrinogenolysis; non-specific plasminogen activation; systemic bleeding.

These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation
                                                                                                                                                                                                                                                                                                                                                                                              Pro-urokinase, thrombolysis, fibrin clot lysis, reduced fibrinogenolysis, non-specific plasminogen activation; systemic bleeding; mutant His 299 Ala300.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and non-specific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing tystemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pro-urokinase mutants - have thrombolytic activity but reduced fibrinogenolysis activity and non-specific plasminogen activation
                                                                                                                                                                                                                                                                                                                                                           Pro-urokinase; thrombolysis; fibrin clot lysis; reduced fibrinogenolysis; non-specific plasminogen activation; mutant Ala300 Ala301; systemic bleeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (NEWE-) NEW ENGLAND DEACONESS HOSPITAL.
